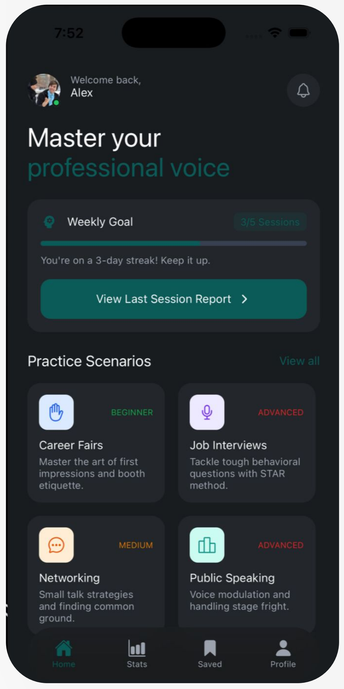
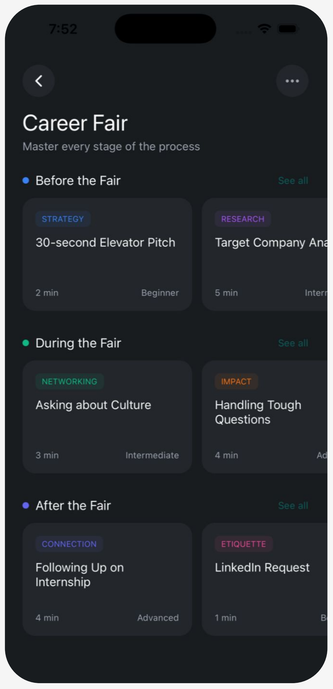
Scenario Selection





About

Drift is an app that uses conversational AI to put users into professional situations to improve their speech. It allows users to practice real conversations in a low-pressure environment. After every scenario, the transcript is sent to an external AI, which will score the user's responses through text and vocal tone. It gives specific tips so the user knows what to focus on improving.

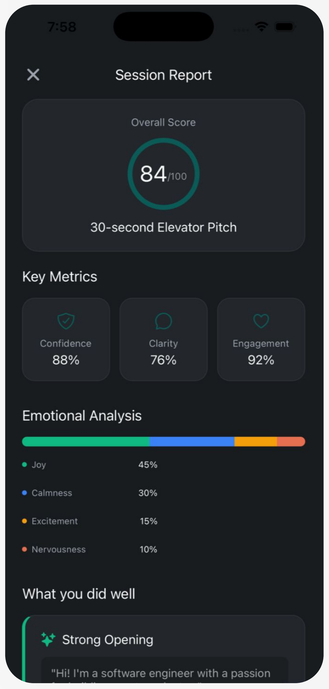
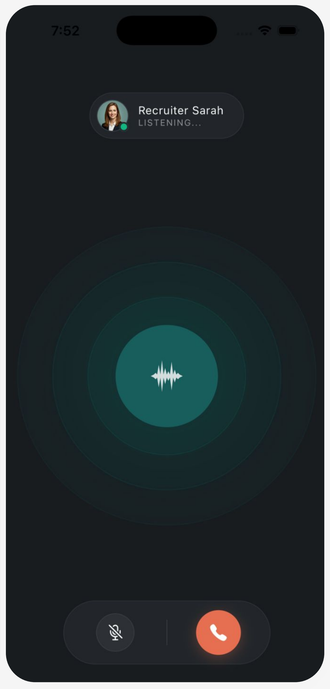
Conversation & Feedback





Motivation

Most people don't know how they would really be in a situation until they experience it. Situations like going to a career fair, getting into the elevator with the CEO, or running into someone in the office can be high stakes, even if they feel casual. I thought I knew how to act in these scenarios, but when it came down to it I had never practiced in them specifically, so I didn't know what to say. This aims to help point users in the right direction.

How It Works

The user selects a scenario and starts a conversation using their voice. The system sends audio to an AI conversation service and receives responses in real time. After the session ends, the transcript is sent to an external AI for scoring and feedback. The results are then displayed to the user and stored so they can view past sessions and track improvement over time.
