This painting is better described as art, not a craft. This is because it’s not just made to exist, but it is supposed to be thought about, and invoke emotion in you. This one especially caught my eye because of the detail, but mostly because of how intensely he is staring at the person looking at the painting. This elicits the feeling of intensity and seriousness, but also intelligence with his hand placement. I think the artist is trying to portray someone with intellect and deep thought. Maybe they wanted the person looking at the painting to reflect on themselves. This is also what the piece says to me personally. It makes me reflect, and to me it feels like its saying brain is better than brawn, even though it has no explicit reference to that.

I do not think AI could create something of equal meaning. It may create something that looks similar, but there would be no meaning behind it. I can apply the concept of art and craft in my software designs and coding by trying to create something that isn't just there to be made. But something with a real purpose, and meaning, and something that I am proud of and spent time on, not something just to make money. I personally think software creation should be an art if done certain ways. If you use AI to generate it, then no, but if you make it, especially something like a UI and do it from scratch, I think it should be. Making something just to make it work would be considered a craft. I tend to mostly ask myself if I am solving the issue I want to solve, or just making it harder when I am designing code. It's easy to make it look better while not solving any issues, and I find myself doing that a lot. This is where I go back and re-factor to make it clean. Especially coming from an MVP. I usually have lots of spaghetti code. I have to go back and it clean up.
